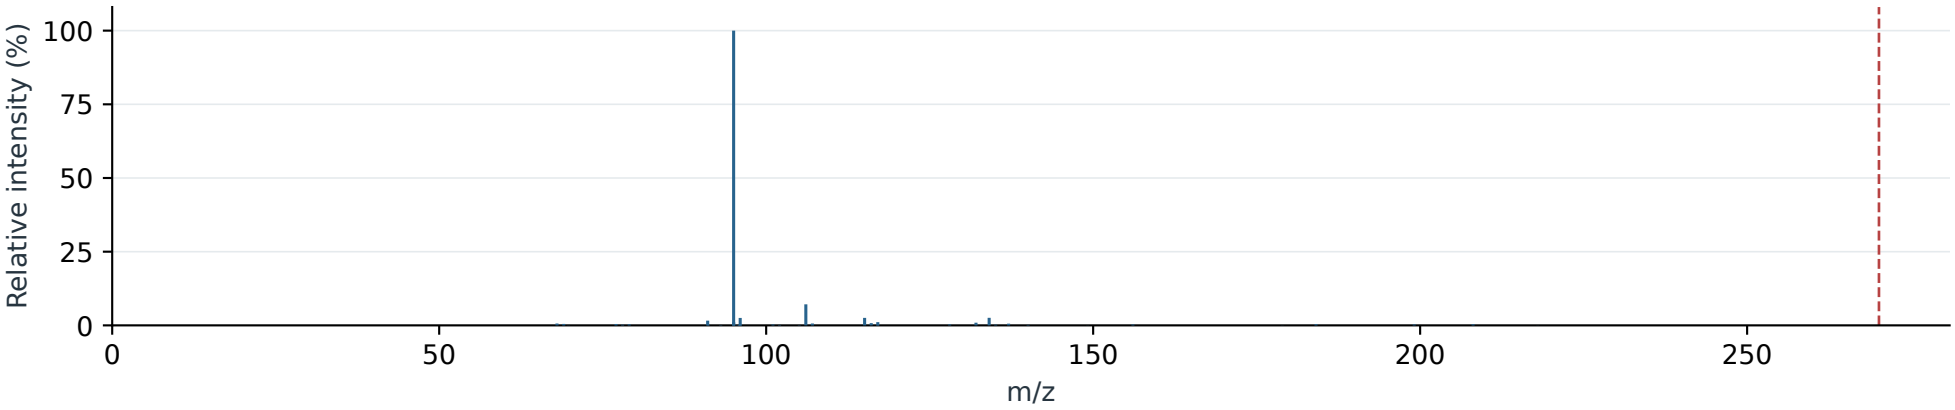
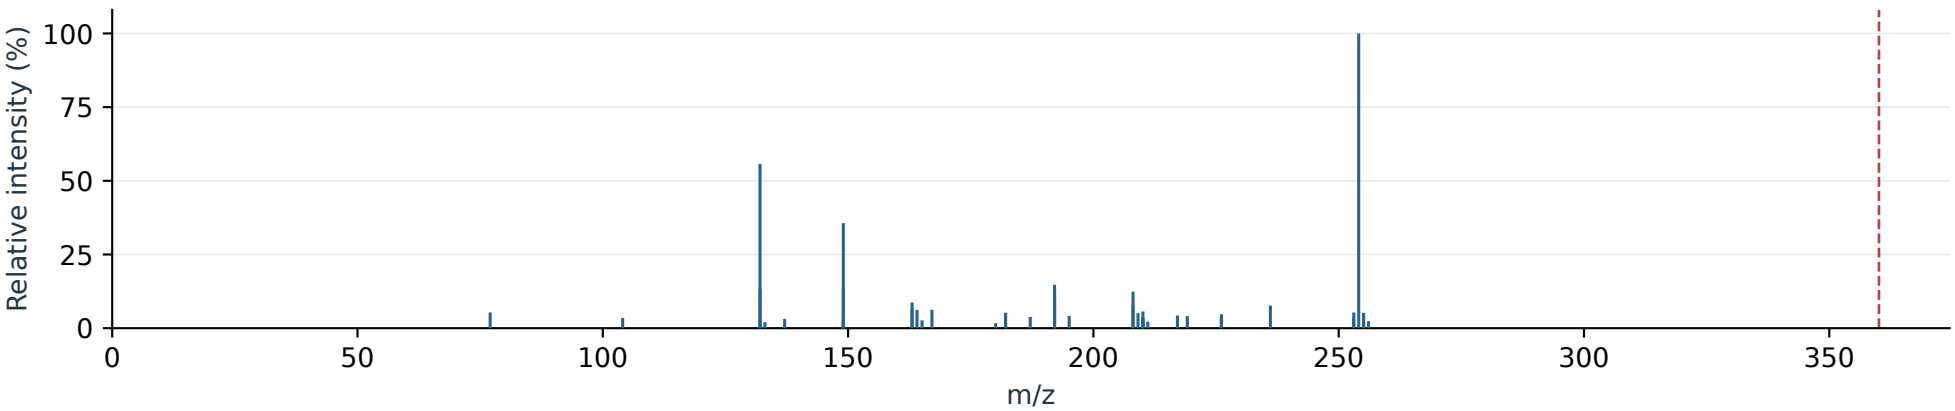
Three actual training spectra: sample inspection

Full valid fragment arrays; no relative cutoff or peak cap applied

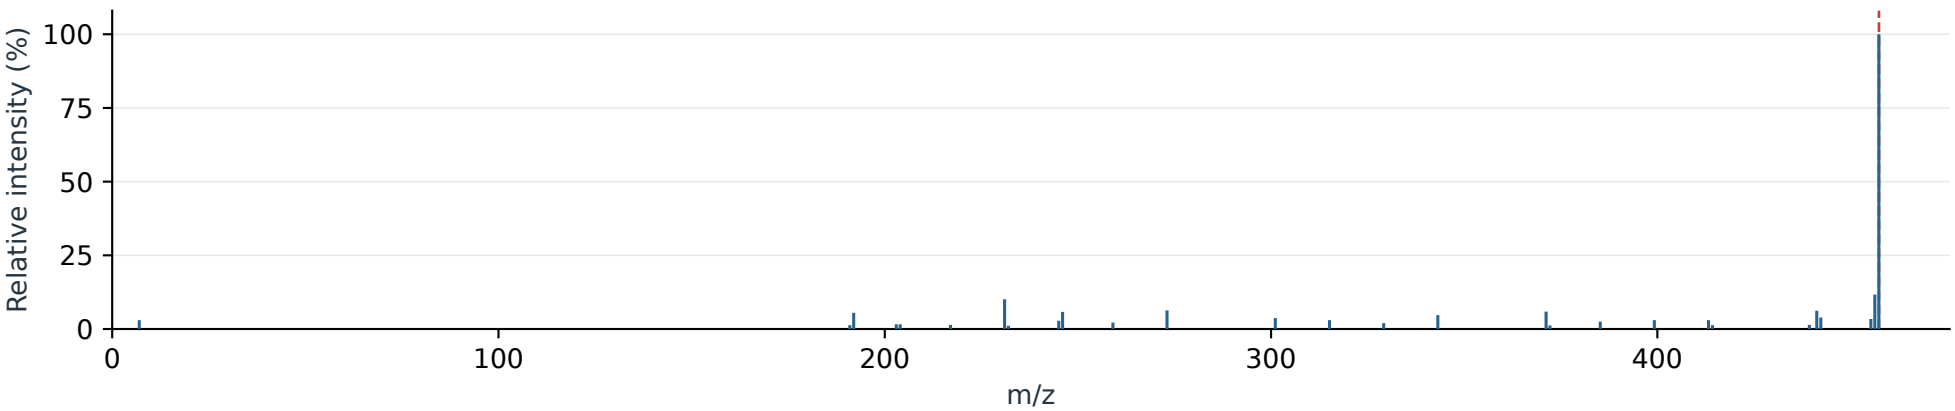
A Typical peak count
row 829,640 | 42 fragments | [M+H]+ | precursor 270.1607
Global median: 42 fragments; recorded base peak: 784,080



B Low recorded signal
row 1,036,294 | 43 fragments | [M+H]+ | precursor 360.1248
Recorded base peak: 3,405; bottom 1% of matched source / instrument / adduct cohort



C Uncommon supplied adduct
row 2,301,556 | 28 fragments | [M+Li]+ | precursor 457.3700
Adduct observed in 6 / 2,539,608 spectra (0.00024%)



Observed fragments Precursor m/z reference

Each spectrum is normalized to its own base peak; normalized heights do not show absolute signal differences.

Low recorded intensity is a cohort-relative observation, not an SNR measurement or an identification-accuracy result.
